

Backup vs standby generators

Backup vs standby generators

So, What Are the Main Differences Between a Standby and Portable Generator?

Posted by Kristopher Schwind

If you're in the market for a generator, it can become easy to feel overwhelmed by the various options. We'll break down the important differences between standby and backup generators so you'll have the information you need to make the most informed decision.

So stop losing sleep worrying about an impending outage or dreading the next one. Instead, learn more about how standby and backup generators can provide you with the assurance and peace of mind you're looking for so that you can rest easy again.

Standby generators, as their name suggests, are quite literally standing by, ready to serve you in the case of an outage. Their systems are perpetually in this standby mode, and they carefully monitor power around the clock. When a power failure is detected, they'll signal their engine to start up immediately, without disrupting operations.

These powerful machines are designed to provide electricity automatically, and to provide a reliable, steady source of power with little to no disruptions. Most will "exercise" themselves at regular intervals for approximately ten minutes at a time to lubricate their engines, charge their batteries, and run a diagnostic check.

Standby generators typically work for up to a few hours at a time, and will naturally cool down when they're not in operation, so you can carry out maintenance activities without disrupting the power supply. It's very important that you conduct regular maintenance checks to ensure that your generator is running safely and effectively.

When you purchase a standup generator, you're making an investment in convenience and peace of mind. You can rest assured knowing that wherever you are when the power goes out, your generator will turn on by itself, keeping your home or business up and running.

That said, the cost of convenience and comfort is reflected in the price tag, and a standup generator will cost you more than a backup option. However, these powerful machines are a well-worth-it investment, providing up to fifteen years of reliable power and peace of mind with relatively low up-keep.

Backup generators, aka portable generators, are not permanent installations, rather, they are intended to provide temporary backup power on an as-needed basis.

Backup vs standby generators

They do not offer automatic outage detection, as do their standby counterparts. Instead, when an outage occurs, the generator's engine must be started manually, so you need to be on-site to get it up and running. Power is then created by setting up extension cords directly from the generator to any desired appliances.

In addition, since most portable generators are powered by gas, you'll need to periodically refill them so that they can continue to provide you with power when you need it.
