

Brussels battery recycling

That is why Bebat has rolled out a new collection system, with redesigned collection boxes, smart collection units and adapted rules that put safety and sustainability first.

Used batteries are no longer of any use to you. Fortunately, most people now know that batteries deserve special attention when they are used up. After all, they still contain plenty of scarce raw materials that we can simply reuse after recycling.

In the global search for environmentally-friendly energy solutions, batteries play a major role. This can be seen, for example, in the rapidly growing market for electric vehicles and home batteries. But even in smaller devices, like your phone and computer, batteries are becoming more powerful and ingenious. To keep up with this rapid evolution, we also need to adapt our collection behaviour to the new wave of batteries that is coming.

Here you can find all the details about Bebat's new collection method.

The Bebat collection cube is a useful tool for collecting batteries. It measures your used batteries and tells you where to drop them off: at a school, at a shop or at a recycling centre.

When you have collected your batteries in the cube, you can simply close it and take it to a collection point. After emptying it, you can just reuse it. Convenient and sustainable!

As you might expect, the "strictest" rules apply in schools. There, you may only take small household batteries, such as AA, AAA, 9 volt batteries and button cells. Fortunately, these are the batteries you come across most often in your household appliances.

Do the batteries not fit through the circular insertion opening? Then take them somewhere else, such as to a collection point in a shop or to a recycling centre. If you are not sure whether a battery is welcome at a school, use your Bebat cube at home to measure it. Does it fit through the circular opening? Then it can go into the collection unit at school.

The small batteries that you can collect in schools are of course also welcome at retail collection points. However, a couple more are allowed there. Medium-sized batteries, such as the battery of your smartphone or camera, a larger (rechargeable) flashlight battery or a block battery can also be placed in the unit.

In short: all batteries that fit in the Bebat cube (not just through the circular opening) may be put in the Bebat collection unit in shops or businesses.

Brussels battery recycling

Small, large, very large or damaged? The recycling centre is the place to go for all sorts of batteries. After all, in addition to the regular Bebat collection unit, there is also an extra-safe, extra-large container especially for your large and damaged batteries. Think, for example, of the battery of your electric bicycle, your laptop battery or the large battery of a drilling machine.

If the battery is too big for your Bebat cube, take it straight to a recycling centre.
