Although renewable energy targets have been revised down, the archipelago's government said that wind and solar will still see their share increase considerably over the next decade.

Aguas de Ponta Preta (APP), the utility for the production and distribution of drinking water and electric power in the Island of Sal, of the Cape Verde archipelago, has commissioned a MW-sized solar power plant.

The Central Solar Fotovoltaica de Ponta Preta project was built at a cost of US\$2.7 million with funds provided by local lender Caixa Econ?mica de Cabo Verde and the utility.

The PV project has a total installed capacity of 1.318 MW, and is comprised of 3,880 modules and 49 inverters. Overall, it consists of a 972 kW ground-mounted system, and four rooftop arrays, which are spread across several APP's buildings.

The installation was primarily built using REC's 345 Wp TwinPeak panels, although it also includes 400 BIPV glass bifacial monocrystalline panels installed on the roofs of the utility's parking areas.

In other news, the Cape Verde government has approved a new plan, "Plano Director do sector Energ?tico 2018-2040", to expand the share of renewables in the islands' electricity mix.

Under the new plan, the local government expects to reach a 30% share of renewables in 2025 and 50% in 2030. The previous plan envisaged a target of 100% renewables by 2021. "This was technically impossible," said the country's Minister of Culture Abra?o Vicente.

"As a small island country and fragile from the environmental point of view, we need to be more resilient, so we have to make a serious commitment to renewable energies and the use of renewable endogenous resources, especially at the levels of wind and solar energy," said Cape Verde's Vice President, Olavo Correia at the commissioning ceremony of APP's solar plant.

Currently, renewables account for about 18% of the archipelago's power demand, with solar having a minimal share of 1%.
