

Commercial ev charging points

"All site work was done efficiently, on time and to budget with minimal impact on a busy, occupied site."

There are a range of business models that can be applied to electric vehicle charging points, each suited to a different business objective. They include:

When considering an EV charging business model, it's important to understand which models will be most effective for the type of visiting driver and the type of location/business where the charging stations will be installed, as well as the typical costs incurred.

Whatever approach you are looking to take, flexibility and scalability are absolutely critical for such a young and fast paced industry.

It's key to work with a charging provider who will take the time to understand your location and make a tailored recommendation on what chargepoints and business model will be most effective.

Tip: Pod Point offer all business models mentioned in this guide and a range of chargepoints, including Solo, Twin, Media and Rapid chargers, all of which offer flexibility to our customers. Our team are always on hand to discuss the options available to you.

With this model, EV charging is provided free to grow market share by attracting and retaining customers, with the costs offset by the increased revenue gained through existing business activities.

As such, your first consideration as a business should be whether you can offer charging for free to maximise the number of drivers you attract to your location, grow brand loyalty and encourage on-site spending.

? Attract and retain more electric vehicle charging customers than with paid for models.

? More suitable for media chargers

? Liability for the costs of the electricity and the chargepoints.

? Less suitable for rapid charging points.
