

Domestic power storage

More and more households are seeking energy flexibility - the ability to use less energy overall and to shift use times to when energy is abundant, clean, and cheap.

At the heart of the energy flexibility revolution? Home battery power.

In short, battery storage in your home can bring the following benefits:

Let's say your home has solar panels on the roof or even a wind turbine in the back garden.

Without battery storage, a lot of the energy you generate will go to waste. That's because wind and solar tend to have hour-to-hour variability; you can't switch them on and off whenever you need them.

"But I don't generate renewables. Can I still have a home storage battery?"

Domestic battery storage without renewables can still benefit you and the grid.

Now that we've got that out the way, let's move on to something a bit more complicated.

Answering this is a bit like trying to answer, "how long is a piece of string?"

There is no one-size-fits-all solution when it comes to home battery power because different households have different energy needs.

Let's look at this in more detail with some hypothetical scenarios.

He typically uses around 1,800kWh of electricity per year in line with the average noted by UK energy regulator, Ofgem. On average, this works out at just under 5kWh per day.
