Energy conservation north korea

You can download our complete Our World in Data CO2 and Greenhouse Gas Emissions database.

In the selection box above you can also add or remove additional countries and they will appear on all of the charts on this page. This allows you to compare specific countries you might be interested in, and measure progress against others.

The data will continue to update - often on an annual basis - with the latest global and country emissions estimates.

Annual emissions figures are often used to compare countries' contribution to climate change. But this metric often reflects differences in population size across the world.

To understand the "footprint" of the average person in a given country, this chart shows per capita emissions.

These figures reflect "production-based" emissions, so do not correct for traded goods.

This interactive chart shows how much carbon dioxide (CO2) is produced in a given year.

This interactive chart shows the year-on-year growth in annual CO2 emissions.

Year-to-year changes in emissions can vary a lot - this can create a particularly "noisy" time series.

When we only look at emissions produced today, we fail to recognise historical responsibility for emissions in recent decades or centuries.

This interactive chart shows cumulative CO2 emissions - the sum of emissions produced since 1751 to the given year. This allows us to understand how much of the total CO2 emissions to date has been emitted by a given country.

How do production- and trade-adjusted emissions compare?
