

Ese solar batteries uk

Generate your own electricity with a solar PV system

With a new solar setup, including a solar battery, you can drastically reduce your electricity bill

Are you considering making the most of your solar panels with the addition of solar battery storage? While there are a wide range of battery options available, the best solar batteries will be the ones that are most suitable for your electricity needs and your budget.

Solar batteries are available in a range of different sizes and capacities, and it is even possible to have more than one solar battery depending on your requirements. What will be the best option will be the one that stores energy in sufficient quantities that it brings you long-term savings that make your solar battery investment worthwhile.

A look at some of the key considerations and features of solar batteries will help you decide which is the best solar battery option for you. If you're not sure what panels you want, check out our best solar panels UK guide next!

Solar batteries are a great addition to a solar PV system as they enable solar power to be stored during the day so that it is available for use in the evening. Solar batteries provide homes and businesses a greater degree of energy independence since they are generating and using as much of the electricity that their own system is producing rather than drawing it from the National Grid. This not only brings you energy bill savings, but also ensures you have battery back up in the event of any outages.

Since solar power is generated from daylight, it is a form of renewable energy and therefore much better for the environment. It helps homes and businesses reduce their carbon footprint and therefore contributes towards the overall UK aim of net zero carbon emissions.

If you are considering installing a solar battery, the likelihood is you are adding them at the same time as new solar panels. You'll therefore want to choose solar panels and batteries that work together well, ideally from the same manufacturer.

In some instances, you may be looking to add a battery to an existing set up, in which case you will need to ascertain what battery is suitable with your existing solar panels. If your solar panels are particularly old then this could be somewhat problematic and mean that your choice of solar battery is somewhat limited.

When considering the best solar batteries for your property, you need to take into account many of the following factors:

Solar batteries used in household settings are typically lithium-ion or lead-acid batteries. Lithium-ion batteries are usually the favoured option since they are more compact, and have greater efficiency and depth of discharge (meaning more of the energy within the battery can be used before needing to be recharged). They tend to be the more expensive battery option.

Lead-acid batteries are a much more budget-friendly solar battery, and though they have lower battery lifespan than lithium-ion batteries, can still be useful in home solar setups where budget is limited. Other types of battery include nickel-cadmium and flow batteries but these are generally used in industrial setups.
