I feel we'd get a lot of mileage out of some large battery storage, and so I have been investigating options. I came across Fogstar, and they seem extremely cost-effective.

Specifically, I've been looking at the rack batteries here:<https://>

But then I came across this:<https://>

This article is my opinion based on my experience using the battery, my research, and the constraints I solved in my system.

The Fogstar Energy 15kWh 48V Rack Battery Bundle, which comes with an amazing server rack for free.

The average electricity consumption of a UK home is around 8kWh a day. I need around 10kWh a day, so the battery I chose needed to cover most of that and output enough power to handle my peak consumption. I estimate this at 4kW.

The 15kWh bundle is built up from 3 x 5.12kWh server rack batteries. Each of the individual server rack batteries can output 5.12kW. This is enough to cover the estimated peak consumption.

The three batteries can output 15kW peak power if your inverter can handle it and the load demands it. This is easily done within the server rack cabinet, which includes a busbar for the parallel connection of batteries inside it.

You can buy the batteries one at a time and buy the server rack separately when you get two or more batteries. In a gradual build-up of storage, you are safe knowing that the same battery you already have in your rack can be bought as an upgrade. This is useful because mixing batteries with different specifications is not advisable.

The rack is sturdy and safe; it comes assembled and has wheels for easy manoeuvring into place. It includes a door that can be locked, which is crucial for the safety of pets and little children. There are additional nice touches to it, too, like the busbar is isolated, and only the terminal connectors are bare. Wide openings at the top and bottom with flexible glands let you run your thick battery cables easily and keep them neat.
