Energy innovation is important because it has the power to enhance economic growth, support energy independence, and improve the health and well-being of the American people.

For these reasons, the U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy (EERE) is committed to leading the nation's transition to a resilient energy economy.

Renewable energy resources provide an affordable, reliable, and sustainable U.S. power supply while reducing the country's greenhouse gas emissions.

To reduce our reliance on fossil fuels, we can harness abundant domestic resources, including wind energy, solar energy, bioenergy, geothermal energy, hydropower, and marine energy.

About 20% of all U.S. electricity now comes from renewable energy sources, 60% from fossil fuels like coal, petroleum, and natural gas, and the remainder from nuclear energy.

Renewable power is not only cost-competitive; it's also the most cost-effective source of energy in many situations, depending on the location and season.

Still, we have more work to do both on the technologies themselves and on our nation's electric system as a whole to achieve the U.S. climate goal of 100% carbon-pollution-free electricity by 2035.

EERE's job is to give Americans access to the energy resources they want at a price they can afford with the infrastructure they can count on.

Learn more about why EERE believes in bringing energy and efficiency improvements to the American people:

We need American-made energy technologies to provide the fastest, most effective, and most lucrative pathway to a sustainable power supply.
