Group 24 Batteries are versatile and compact power sources commonly used in vehicles, boats, and RVs. Their dimensions are typically L 10.25 x W 6.81 x H 8.88 inches, making them space-efficient. Despite their size, they deliver high performance and have a long lifespan.

To choose the right Group 24 Battery for your needs, consider factors like battery chemistry, reserve capacity, cold cranking amps, and maintenance requirements. In this article, we'll delve into the dimensions, features, and recommendations for Group 24 Batteries, helping you make an informed decision when selecting the ideal power source.

Group 24 batteries are a type of lead-acid battery that is commonly used in vehicles and other applications that require a reliable power source. These batteries are designed to provide a high level of performance and durability, making them an ideal choice for a variety of different applications.

One of the key features of Group 24 batteries is their size. These batteries are typically L 10.25 x W 6.81 x H 8.88 inches and are commonly found in AGM and SLA batteries as well as lithium-ion, gel-cell, and flooded batteries.

The physical dimensions of a battery dictate its group size. That doesn't mean the greater the battery, the bigger the group. The size of the battery is determined by the physical dimensions of the battery.

Group 24 batteries are also known for their high reserve capacity (RC) and cold cranking amps (CCA). RC is the number of minutes a fully charged battery at 80°F (26.7°C) can be discharged at 25 amps and maintain a voltage of at least 10.5 volts for a 12-volt battery. CCA is the number of amps a fully charged battery can deliver at 0°F (-17.8°C) for 30 seconds while maintaining a voltage of at least 7.2 volts for a 12-volt battery.

Group 24 batteries come in different sizes, but they all share the same BCI group number. This means that they have the same dimensions and terminal placement, making them interchangeable in most applications. Here are the dimensions and features of a typical group 24 battery:

Most group 24 batteries have a rectangular shape with rounded corners. The terminals are located on the top, either on the side or in the middle, depending on the manufacturer. The positive terminal is usually larger than the negative terminal to prevent reverse polarity connections.

Group 24 batteries are commonly used in marine, RV, and automotive applications. They are also suitable for

Group 24 battery meaning

solar PV systems and other off-grid power sources. The compact size and high energy density make them a popular choice for portable power packs and emergency backup systems.

When choosing a group 24 battery, make sure to check the dimensions and terminal placement to ensure compatibility with your equipment. Some manufacturers may offer variations on the standard size, such as group 24F or group 24M, which may have different dimensions or features.

The capacity of a battery refers to its ability to store energy. The capacity of a Group 24 battery can range from 66-110 Ah. It is important to choose a battery with the appropriate capacity for your needs. If you have a vehicle with high electrical demands, such as a large RV or boat, you may want to consider a battery with a higher capacity.
