The lead-acid battery is a type of rechargeable battery first invented in 1859 by French physicist Gaston Planté. It is the first type of rechargeable battery ever created. Compared to modern rechargeable batteries, lead-acid batteries have relatively low energy density. Despite this, they are able to supply high surge currents.

With over 230,000 units sold globally in the past six years, the Renogy 12V Deep Cycle AGM Battery has become the top-selling lead-acid battery on Amazon. The Renogy Deep Cycle AGM Battery features an integrated internal structure and sealed design, sparing you from intricate internal troubleshooting.

The capacity of a lead acid battery, measured in amp-hours (Ah), represents its ability to deliver a constant current over a specific time. At its core, capacity is determined by the number and size of the battery's plates, as well as the electrolyte concentration.

This article examines lead-acid battery basics, including equivalent circuits, storage capacity and efficiency, and system sizing. Stand-alone systems that utilize intermittent resources such as wind and solar require a means to store the energy produced so the stored energy can then be delivered when needed and the resources are unavailable.
