

## Iran electricity safety

The quality of Iran's electricity network has improved significantly in the last ten or so years. Gone are the days of frequent and prolonged voltage fluctuations and power outages. However, due to financial issues in the debt laden sector, especially in the summer months as demand rises with the temperature, electricity generators and ...

However, the country grapples with gas shortages every winter and summer. [i] In 2023, Iran experienced a daily shortage of 250 million cubic meters of gas, while in 2024, the imbalance is expected to reach 300 million cubic meters a day. [ii] Indeed, Iran's power industry warns of a 30% energy deficit by next summer.

ISLAMIC REPUBLIC OF IRAN (Updated 2020) PREAMBLE. The Islamic Republic of Iran has one operating nuclear power reactor, Bushehr Nuclear Power Plant (BNPP), Unit 1, where a total of 42 199 million kW.h electricity has been generated from March 2011 to March 2020. BNPP-1 provided 1.84% of national electricity production in 2019.

To reduce CO 2 emissions and exposure to local air pollution, we want to transition our electricity away from fossil fuels towards low-carbon sources. "Low-carbon electricity" includes nuclear and renewable technologies. This interactive chart allows us to see the country's progress on this.

At present, a large amount of electricity in Iran is generated using fossil fuels. These energy resources are limited and there are environmental concerns like GHG emissions associated with the power generation using these fuels.

The Islamic Republic of Iran has one operating nuclear power reactor, Bushehr Nuclear Power Plant (BNPP), Unit 1, where a total of 42 199 million kW.h electricity has been generated from March 2011 to March 2020. BNPP-1 provided 1.84% of national electricity production in 2019. Since 2011, it is calculated that its operation has prevented the consumption of 11.244 billion m3 of natural gas, equivalent to 66.7 million barrels of crude oil, and the release of 37.7 million tonnes of pollutant or greenhouse gases into the environment. The Islamic Republic of Iran also plans to expand its nuclear power programme over the long term. In this regard, construction of BNPP-2 with a capacity of 1 057 MW(e), was started in September 2019.

This report provides information on the status and development of nuclear power programme in the Islamic

Republic of Iran, including factors related to the effective planning, decision making and implementation of the nuclear power programme that together lead to safe and economical operation of nuclear power plants (NPPs).

The CNPP summarizes organizational and industrial aspects of nuclear power programme and provides information about the relevant legislative, regulatory and international framework in the Islamic Republic of Iran.

The energy policy of the Islamic Republic of Iran is explained in the National Energy Strategy Document, which sets out policies through 2041. Approved by the Cabinet of Ministers on July 2017, the document outlines a comprehensive set of long term goals and strategies in the country's energy sector. This document is also aligned with its Twenty-Year Vision, the sixth national five year development plan, and macro-policies related to energy, resistive economy, and environment.
