The last decade saw the meteoric ascent of many Chinese automakers, which not only started building and selling more (and better) cars on the local market but also expanded beyond the borders of the People's Republic to become global brands. And by and large, they aren't making these big waves with gasoline-powered cars. One such success story is BYD--an acronym for Build Your Dreams--which was founded almost 30 years ago and is challenging and even surpassing the automakers it was trying to initially emulate.

As with many of its Chinese counterparts from the early 2000s, the rest of the world initially didn't take this automaker seriously, often because of the copycat cars it initially produced and its lack of technical and design innovations.

How things change. In the years since, BYD has become arguably the tip of the spear for China's unmatched global EV ambitions. In 2023, the company sold over 3 million vehicles around the world, an impressive achievement when you consider it sold about 427,000 vehicles in 2020. That's an almost sevenfold sales increase in just three years, and since March 2022, it has announced that it is shifting its production and resources away from combustion engine vehicles and going all-in on EVs.

And this week, it made international news for surpassing Tesla in global EV sales--a feat that many industry watchers had anticipated for months that's now come to pass.

So what exactly is BYD? What cars does it make, and why is the rest of the world finally taking notice? Let's dive in with this inaugural edition of EV 101, our new compendium of beginner-friendly guides to the world of electric cars.

BYD was founded in China in 1995, starting out with just 20 employees. It opened its first overseas office in Rotterdam, the Netherlands, three years later, in 1998, and it began building its first industrial park in China in 2000. Its industrial park in the Pingshan District in Shenzhen, China, was completed in 2007 and has served as the company's headquarters since. BYD opened a North American headquarters in Los Angeles in 2011 after the city put in a huge order for electric buses. Its parent company, BYD Company Ltd, makes a lot of products including solar panels, industrial equipment, electronic parts and more.

The BYD F3, an early sedan model.

The company wasn't initially an automaker, and its first two major contracts were to supply lithium-ion batteries for mobile phones to Nokia and Motorola. Its automotive ambitions began with the 2003 acquisition

Is byd a chinese company

of Xi'an Qinchuan Automobile.

By 2005, its first production model, the F3 compact sedan, was already on the market, and in 2008, it introduced a plug-in hybrid variant of the model called the F3DM. Interestingly, this early PHEV was shown by BYD at the 2008 Geneva Motor Show, already hinting at the automaker's international ambitions. But even then, the cars had such suspect quality, designs and technology that they were hardly taken seriously by the rest of the world.

In 2008, Warren Buffet's Berkshire Hathaway investment company purchased \$225 million in shares--largely out of interest in its battery business--giving the brand a big boost. In the subsequent years, the huge investments into and incentives for EVs by the Chinese government helped push BYD and the rest of China's auto industry into a kind of surprise world leader, something that really didn't become readily apparent until after the pandemic.

Today, the company is enrolled in several programs and agreements with various companies and governments around the world to promote electric vehicles, extract raw materials for EV batteries, and build more manufacturing facilities to support its massive expansion.
