But due to the varying information available on the web, users still need answered queries. Therefore, we are going to provide you with facts. And all in one place!

Have you ever wondered how we can develop super-slim phones and electric cars now? Yes, all thanks to the lithium battery! We vastly use lithium batteries because they are: Highly efficient Charge for longer Much less toxic than other batteries Portable Great with energy-storing capacity Smaller and lighter as compared to traditional battery types Practical and powerful Less expensive Lithium batteries have replaced the previous generation Nickel-Cadmium batteries, and rightly so! (You'll get more detail below) What Are Lithium Batteries and How Are They Different From Ordinary Battery? Lithium batteries are the latest generation batteries that use lithium to hold a charge. These batteries are more powerful and portable than previously used batteries.

Lithium batteries work on some simple chemistry rules. Since lithium is the lightest metal in the whole periodic table, it is eager to lose electrons. The lithium acts as a positive electrode, and the graphite is the negative one. The lithium-ion transfers the charge between the two electrodes in the battery. The main difference between lithium-ion batteries from nickel-metal or nickel-cadmium batteries is their lack of memory effect. The memory effect reduces the longevity of the battery. Lithium, however, has self-discharge properties, due to which it retains more energy. Therefore, lithium batteries in laptops are far better than other ordinary batteries.

Want to know more about the mechanism of lithium batteries? See this [video](#)! What Type of Lithium Battery is Used in Laptops? Broadly speaking, there are two types of lithium batteries, Lithium Polymer battery (Li-poly) and Lithium Ion (Li-ion). Li-poly uses a polymer instead of a liquid as an electrolyte. These polymers are semi-solid with high conductivity. As the name suggests, the Li-Ion variant uses the reduction process of lithium ions to supply energy. The reversible reduction phenomenon makes it portable.

Fact: 95% Laptop have Lithium Batteries due to its portability, longevity and reliability Are Lithium-Based Batteries Safe? Lithium-based batteries are usually safe and won't fail. The batteries also don't pose any danger if they are used appropriately. However, the battery should not be defective or damaged. Lithium batteries can get damaged from improper storage or charging. If the battery is not operated safely, it can cause an explosion or fire hazard. Although it is less likely, you can take the following measures to prevent any unsafe incident.

Fact: Lithium Batteries are more safe than any other type of batteries For more information on preventing explosion or fire injury from lithium batteries, refer to this document by OSHA! What is the Lifeline of Lithium Batteries? A lithium-ion battery can last for almost 3 to 5 years. It also means 300 to 500 charge cycles. A charge cycle is a duration in which the battery fully charges, fully discharges, and then fully powers

again. However, the exact lifeline of the battery depends on its use and maintenance. Certain factors can increase or decrease the lifecycle of the lithium battery. The battery's lifespan reduces due to improper or over-charging, extreme weather conditions, and long-term use.

The laptops also use a lithium-ion battery. The lithium ion moves between electrodes to provide charge for the battery. The lithium polymer battery, however, is not rechargeable. It is used in clocks, watches, toys, etc. 3- Are Lithium batteries safe to use? Yes, generally, lithium batteries are safe to use. There is the least risk of any dangerous outcome. However, these batteries can be a source of fire or explosion hazard under certain circumstances of unsafe use.

These include Physical damage to the battery Exposure to extreme temperatures Overcharging or inappropriate charging method Not following the manufacturer's safety instructions. 4- Do laptop chargers have lithium batteries? No, laptop chargers commonly do not have lithium batteries unless they have a built-in power bank. A laptop charger has a simple power cord and a transformer that converts the current from AC to DC. However, lithium batteries are present in laptops, which are rechargeable and portable. 5- Do lithium-ion batteries explode? Yes, it is possible. But, it is a rare scenario and usually occurs if the safety instructions of the battery are not followed properly.

Do laptops have lithium batteries? Yes! Laptops employ lithium-ion batteries as they are rechargeable and portable. You can easily check it by reading its label. These batteries have revolutionized communications because they are practical and pose the least threat or danger. However, you must handle the battery with care. Follow the proper guidelines for charging, using, and storage. You can also extend the lifeline of your lithium battery by keeping it in good condition.
