## Off grid home solar systems

Solar PV panels offer the best off-grid power option, according to our expert, but there's a lot more to a PV system than just the panels.

The folks who built my house in the early '70s must have been back-to-the-land warriors because it's completely off-grid. When my partner and I bought it, the property had a functioning--although undersized--solar energy system, but that was destroyed by a lightning strike a few years ago, and we've been plugged into the neighbor's house ever since while we figure out our options.

Needless to say, the situation has given me a personal interest in off-grid power systems. One thing I've learned is that the solar equipment that would fulfill our fairly moderate energy needs is far more expensive than I had previously thought, even with the 30 percent federal tax incentives. There's no possibility of supplementing it with wind turbines because we don't get enough wind. Other power options, such as micro-hydro, are off the table simply because of geography.

For this post, I consulted with Joseph Guido, a local contractor who has been installing solar equipment since the 1970s. "Some people around here have a good wind set-up," he told me, "but the best off-grid system is solar." He explained how to size a system to meet the household's requirements, how to use solar water heaters to reduce electricity needs and how to plan for extended cloudy periods. He also provided pointers for property owners who have enough wind to run turbines and streams close enough to generate hydropower.

Whether you're planning to build a cabin in the woods or a multifamily home on an isolated mountaintop, this post is for you.

When the sun goes down, clouds gather, and the wind stops blowing, you can't rely on the utility company for backup if you're off-grid. Unless you run a generator during those times, which requires fuel and isn't something most off-grid homeowners would want, you need a battery bank to store energy to get you through the doldrums.

Guido recommends doing an energy analysis to size your battery bank (and electrical generation equipment). This means adding up the power draw of all the electrical equipment you plan to use and estimating the maximum number of consecutive days you expect to be without sun or wind in the winter. Online battery-bank calculators can help you size your system.

Lead-acid batteries are cheaper than lithium ones, but they're less efficient, so you'll need more of them to get the same storage capacity. They can be an economical choice if you're powering a small cabin. Still, for a single-family dwelling, Guido recommends lithium batteries, which are more compact,

# Off grid home solar systems

longer-lasting and require less maintenance. He advises choosing LiFePO<sub>4</sub> over lithium-ion batteries. They last four to five times longer, and the latter are a known fire hazard.

The three most common ways to generate power for an off-grid residence are photovoltaic (PV) panels, wind turbines and micro-hydro generators.

Once you've got the equipment to generate and store renewable energy, you need an inverter to sync the electrical signals from the generator and battery to your home's electrical system. You also need a charge controller to prevent the batteries from overcharging.

If you require more power in the future -- perhaps to accommodate a new appliance -- you can add more panels and batteries, but Guido warns that the inverter and charge controller create a choke point, so it's wise to oversize them during the original installation. In general, the inverter should be able to handle 20 percent more than the maximum number of watts you expect to use (if you consume 3,000 watts at one time, you need a 3,600-watt inverter), but you might want to bump that up to 30 or even 40 percent to make sure you're ready for expansion.

The best inverter is 98 to 99 percent efficient, which means it wastes little energy in converting DC to AC. It also has a long warranty. Most manufacturers offer a 12-year warranty, but some guarantee their products for as long as 20 or 25 years.
