

Photovoltaic pv systems cyprus

Photovoltaic pv systems cyprus

WORKING DAYS/HOURS Monday to Friday 7:30AM – 5:30PM

Photovoltaic systems in Cyprus are the best renewable energy systems. Cyprus is a sunny island. Moreover, photovoltaic systems produce energy from sun. As a result Solar energy is a kind of a free renewable energy.

In simple words PV systems firstly absorb this energy. Then eventually they convert it into electricity. Therefore, every building shall install such a system.

Net metering is a special scheme. With this Electricity Authority charges the consumers. In simple words is like this. You install a net metering system on your premises roof. Then the PV system produces electricity using solar energy. Afterwards this electricity is sent to your building for consumption. During the day any excess of energy, is send to the Electric Utility Grid.

Finally at the end of each billing period charge is fair. Thus the consumer pay the difference of the electricity he draw from the Grid. From that we have minus the energy he send to it. Is the most suitable system for house owners today.

Net billing scheme is another Cyprus plan for PV systems. The capacity for these systems starts from 10 kW. The maximum they can go up to 10 MW. This plan does not drain funds from Grid Operating Authority.

Both residential and commercial owners can apply. Although is important mention that they are only eligible for net billing depending on their energy profile. Their generator of PV shall provide a maximum 80% of their annual energy needs. In addition the capacity can rise up to 100% only if they use storage batteries.

The Grid operator charges the consumers on energy taken consumed from the grid. This is charged at the retail electricity price. On the other hand, the clients receive a credit for any excess energy they inject back into the grid. Important is to mention that the credit is based on a variable tariff. This tariff is the EAC production avoidance cost! This is happening every billing period.

The solar module converts solar energy directly into electricity. Solar cells compose the panels. Usually, robot machines assemble them mechanically.

Crystalline photovoltaic solar cells consist of a layer of semiconductor material.

The most common of which is silicon. This could be black or blue colour. They vary in size from 4 to 6 inches.

All photovoltaic cells are usually arranged in thin flat layers. Then they are connected to each other.
