Due to the finite nature of non-renewable resources such as coal, oil, and gas, and the increasingly alarming effects of climate change, it has become imperative to look at alternative power sources.

One such solution is wind turbines that convert the wind's kinetic energy into electrical energy for powering residential and commercial properties, along with other infrastructure.

With the UK undergoing significant changes when it comes to electricity generation and its plans to reach a target of net-zero carbon emissions by 2050, it is shifting to cleaner and greener energy and is in the final phases of installing the world's largest capacity of offshore wind.

The government is also pushing home and business owners in the country to generate their own clean electricity through renewable energy sources such as the wind and sun.

To make this a viable solution even when there is no wind blowing, houses and business premises with wind turbines must invest in wind turbine battery storage systems.

What are wind turbine battery storage systems? These are battery systems that use chemical reactions to safely store energy produced from the wind turbines to be used later, such as when the wind isn't blowing, allowing for an uninterrupted power supply throughout the property.

The UK is Europe's windiest country with approximately 40% of all wind energy blowing over it. This gives it an edge in using and harnessing wind energy to produce clean and green energy.

Wind turbines work in a very simple way, and the stronger the wind is, the more electricity will be generated. Here's how:

For large-scale commercial electricity generation, a cluster of wind turbines, known as a "wind farm" is used to produce energy.

When talking about a residential property or a business premises, there are 3 types of wind turbine systems: roof-mounted, standalone, and micro domestic turbines.
