

Public charging stations near me

Public charging stations near me

There are three main types of chargers that you will encounter: Level 1, Level 2, and Level 3 (also called DC Fast Charging):

Level 1 charging uses a standard 120V outlet that you are likely to find in your garage. This is the slowest type of charging and will add an average of 5 miles per hour of charge. Also called "trickle charging," this type of charging is not offered commercially and is typically only used at home.

Level 2 charging requires a 240V outlet. These chargers can be installed in your home with a basic electrical upgrade and are very commonly used for public chargers. Level 2 chargers add 20 to 60 miles per hour of charge.

Level 3 chargers, or DC Fast Chargers, are only used in commercial settings. These chargers are most often found along highways since they provide 60 to 100 miles per 20 minutes of charge. For example, the West Coast Electric Highway project is working to install DC Fast Chargers every 25 to 50 miles from the British Columbia to the Mexico border.

If you're able to charge at home, that is likely the easiest and most affordable option. If not, the City is working to expand public charging opportunities, with a focus on providing more convenient, safe and affordable chargers near multi-unit dwellings and commercial centers. Many workplaces also offer EV chargers in company parking lots or garages, so don't forget to check with your employer when considering your charging options.

Portland has worked with private sector partners to provide convenient, accessible charging for drivers since 2011 when Electric Avenue opened in downtown Portland, one of the nation's first fast charging pods in the public right-of-way. The City has continued working to expand opportunities to charge since then, most recently with a new policy that is being developed to permit the installation of EV chargers in the public right-of-way in areas across the city.

There are several maps you can use to find available public charging stations and sort by network, connector type, power supply, price, and other filters. A few that are useful to be familiar with include the Department of Energy's Alternative Fuels Data Center, Plugshare, and ChargePoint.

How to charge your electric vehicle:

2. Make sure you can access the network
3. Park in the appropriate spot next to the charger

4. Follow instructions to plug the charger into your vehicle
6. Keep an eye on your charging app so you can move your car once the charge is complete
