Retail store energy storage belmopan

Partnering with landowners, investors, communities, and our customers on renewable energy projects to solve the energy challenges of our time.

We're a U.S.-based developer with deep expertise across the complete project development cycle. We work closely with partners to build highly productive, grid-scale solar power, energy storage, and green hydrogen projects throughout North America.

Since our inception, we have signed nearly 6.3 gigawatts (GW) of power purchase agreements, have more than 8 GW of additional projects in the development pipeline, and have 0.8 GW of projects in the operation pipeline.

Note: This map highlights only a few of our many projects.

Shopping malls and similar venues present attractive, big-time opportunities as potential sites for grid-connected solar power, energy storage and intelligent, highly energy-efficient facilities management. A growing, international host of big-box retail, shopping mall owners, architects and building-integrated solar (BIPV) and energy management specialists are joining forces so as to capitalize on the benefits.

Asked about market growth and why every big-box retailer and mall rooftops and parking lots aren't covered with solar-plus-storage and converted into distributed, grid-connected, emissions-free power plants, Drew Torbin, co-founder and CEO of U.S.-based Black Bear Energy had this to say: "The scale is ramping up."

The built environment is a massive, great thing, and there is massive market potential out there. There always exists what's possible and what's probable before it's inevitable. We're seeing that. It's a question and concern for smaller and smaller big-box retailers not to support solar now, especially when they see the scale at which some retailers are deploying solar. So it's in the realm of possibility for them economically, and the range of states that fall into that range is growing.

Black Bear Energy's origins stretch back to Torbin and fellow Black Bear Energy co-founder, executive vice president and chief procurement officer Kim Saylor-Laster's experiences developing their first energy-efficient buildings and facilities energy systems management work, Torbin for Prologis, and Saylor-Laster for Walmart. Attracting venture capital from a variety of professional investors, they founded Boulder, Colorado-based Black Bear Energy in 2015 and have been hard at it and growing since, Torbin said in an interview.

Black Bear provides clean energy advisory services to institutional real estate investors that own and manage commercial, industrial, residential and mixed-use real estate across the US, Torbin explained. The pioneering

company has participated in solar power projects with real estate developers and owners with more than 3 billion square feet (278,709,120 square meters) of real estate assets under management solely by word of mouth.

To date, Black Bear has advised and helped clients invest in and implement distributed solar and energy efficiency projects at shopping malls, stadiums and parking lots of various kinds. "We've done work in just about every different type of commercial real estate asset and environment," Torbin told Solar Magazine.

A typical retail or commercial project's systems configuration typically centers on solar power generation at this point, Torbin explained. "Solar PV plus storage is limited; the economics are viable in only a handful of markets today," he said.

The growth of community solar projects in a growing number of U.S. states where shares of solar power and resulting savings produced by solar power generators are distributed across a group of subscribers is boosting investment and deployments by big-box and smaller retailers, however, Torbin highlighted.
