This report describes accuracy enhancement of Solargis solar resource ...

Malawi has had a crisis in getting energy to its people, with three-quarters of its people having little to no access to electricity. That problem has only gotten worse due to the devastation of cyclone Freddy. However, there are more and more solar panel projects that are cropping up across the country to solve that problem. Here's everything you need to know about the benefits of solar panels, the projects that are getting off the ground, and what the future can look like for renewable energy in Malawi.

Solar panels are a great way to rapidly expand electricity access for more remote areas of Malawi. Over the past decade, the global cost of solar power has dropped significantly--by three quarters.

Solar power can connect people in remote places to more efficient ways of conducting business, growing crops, or accessing their hobbies.

For example, people can now be sunflower farmers since oil presses are now available that weren't before solar panels were installed. Solar panels also make life more disability-friendly for people with chronic illnesses or who have to use wheelchairs. Not having to make extensive treks from one place to another can make it easier for those people to make a living.

The versatility of access that renewable energy brings to the table benefits a country like Malawi, which has historically struggled with bringing power into its more rural areas. This isn't to mention the environmental benefits of renewable energy.

There are many exciting solar projects currently popping up across Malawi.

It will have the capacity to generate 7 GWh of electricity every year, fed into the Electricity Supply Commission of Malawi (ESCOM) network. The project has also benefited from the U.S Development Finance Corporation and the Africa Trade Insurance Agency's financial aid.

The lowering cost of solar energy and the more remote access that it gives to electricity makes the future of Malawi's power grid seem much brighter. After Cyclone Freddy has battered Mozambique and given way to over 400 fatalities, the time is now to rebuild. Reconstructing the destroyed homes and buildings with a forward-facing mindset towards a better economic and social model with electricity access could mean that we leave the disaster looking up rather than back.

The future for Malawi can be filled with more irrigation and industrial opportunities, as well as greater access to entertainment like sports betting or television. If foreign funds can be appropriately used and agreed upon

for building a robust solar grid across Malawi, the future is full of possibilities.

The Bwengu Solar PV Power Plant will spread over 105 hectares of land and is expected to be built at a cost of \$65 million within 12 months. The facility will be located in Ulalo Nyirenda village, which is just 1 km from the Bwengu Escome Substation power grid.

The groundbreaking ceremony for the Bwengu Solar PV Power Plant.
