Spain has adopted a target for 81% of its electricity to come from renewable sources by the end of 2030 to meet its climate goals, the government announced on Tuesday.

In the plan, adopted by ministers and sent to the European Commission, the government committed to reducing greenhouse gas emissions by 32% compared with 1990 levels.

To achieve this, the government promised to accelerate the deployment of renewable energies to produce 81% of Spain's electricity from 'green' sources by the end of the decade; a seven-point increase on 2021's 74% target.

'We believe this is an ambitious but achievable goal,' said ecology minister Teresa Ribera (main image), who was appointed last week as EU commissioner. ALSO READ: Spanish minister Teresa Ribera gets top EU role steering climate transition.

This will reduce 'Spain's energy dependency' on foreign sources, the minister added, projecting it will be reduced from 61% currently to 50% by the end of the decade.
