

Syria residential solar

Due to the war, destruction of the energy sector, and control of fossil fuel resources, Syria is facing tough times in fulfilling the demand for electricity. Syria was an electrified nation right before the outbreak of war in 2011 and almost 95% of the nation's homes had been connected to a reliable grid system. But the war and the damage to infrastructure over a period of a decade have changed everything.

Power stations were destroyed and the Syrians are pushed to rely on expensive diesel generators to power up their needs. Now there is a ray of hope in the nation in the form of solar power. Most find solar panels as the cost-effective and reliable option.

Energy Crisis Plunges Syria To Darkness

Because of the years of war of more than a decade and deficiency, there is the worst fuel crisis faced by the nation. The extended electricity hours made Syria fall into darkness and the nation encountered a constant black-out in most areas. The electricity situation has become complicated and chaotic and people are left only with the choice of using costly diesel generators available in the black market, which were too expensive to buy.

The energy crisis which has been increasing since 2012 clearly indicated that the nation was unable to secure sufficient energy. Three mechanisms are being adopted by the government to have control over energy distribution:

Among surveyed households, access to electricity has been ranked as the top third highest priority for the people. The fuel shortages and widespread power cuts have impacted majorly of almost all sectors.

Right before the war, Syria was producing 380,000 barrels, in a day. But as the major oil fields of the country (in the east) lie under the control of US-backed Kurdish forces, production has collapsed.

The crisis has affected the important sectors of Syria and the living conditions of Syrians have worsened. Some of the areas receive as little as 15 minutes of power supply in 24 hours. Protestations are going on against the widening fuel shortages and worsening economic situation.

2022 has become the worst ever year, fuel costs are going up and even not available at all, factories are shut due to non-operation and classes are canceled in universities.

The lack of power has collapsed the entire of Syria - healthcare, industries, water systems, and schooling. People are exhausted without electricity.

Solar Energy - The Right Choice For War-Ravaged Syria

In Syria, where fuel prices are going up and are unreliable, the eyes are focusing on solar energy as the best possible alternative to highly-expensive diesel generators.
