World Bank data shows that Tajikistan, a central-Asian country of 10 million people, is among the poorest nations in the region with a GDP per capita of \$1,054 as of 2022. About 10% of the population lives without electricity in isolated mountainous villages that lack the infrastructure to install power lines. Sadly, this number significantly multiplies in winter months. Due to outdated Soviet-era designs, the Asian Development Bank (ADB) believes that energy use is inefficient with Tajikistan using three times more energy than developed countries to increase GDP by one unit. Overall, USAID reports that, as of 2019, 26% of the population lived in poverty, with 11% in extreme poverty.

Nonetheless, it appears that an encouraging future lies ahead. Since independence, the Tajik government has been subsidizing electricity across the nation and the specialization of renewable energy in Tajikistan unveils a frontier of untapped possibilities to eliminate poverty. Given that impoverished households are able to access electricity at more affordable costs, healthier and more efficient forms of cooking, studying and heating become accessible and reduce poverty.
