Tesla powerwall estimate

How much is a Tesla Powerwall?

The cost of the Tesla Powerwall has been up for debate since its release, with figures ranging in various directions.

As of November 2021, there have been approximately 250,000 Tesla Powerwalls installed across the globe, spanning from the United States to Australia.

So why is the cost of a Tesla Powerwall still somewhat of a mystery? Surely we have enough real-world applications to establish an accurate estimated cost?

One such reason could be that a Tesla Powerwall's cost differs from location to location.

For this reason, we thought it necessary to conduct our own study to provide you with some further insight into the matter.

In this article, we establish how much you can expect to pay for a Tesla Powerwall if it's worth the money and what you can expect regarding a return on your investment.

As of 2024, the total cost of installing one Tesla Powerwall battery is \$11,500, excluding any solar tax incentives.

The following table illustrates the price difference per number of Tesla Powerwalls purchased:

The cost of a single Tesla Powerwall decreases as you add more units to your home storage system. One Powerwall will cost you \$11,500, while two will set you back \$18,500 (\$9,250 per battery). Tesla's tiered pricing structure continues to the largest system possible: 10 Powerwall batteries for \$80,500.

Generally, your home will require a minimum of 2-4 days' worth of power autonomy during a prolonged blackout, which depending on your electricity consumption, will require around 1-3 Tesla Powerwalls.

When establishing our Tesla Powerwall quote, we spoke with a Tesla representative who informed us that the prices listed above include installation costs.
