## Types of solar power inverters

Types of solar power inverters

There are three types of solar inverters available to homeowners. These types are string (or central) inverters, power optimizers + inverter, and microinverters. Each different type of solar inverter has its...

To recap, there are three kinds of inverters: string inverters, microinverters, and power optimizers. They all transform the power your solar panels generate from direct current (DC) to alternating current (AC).

Decided to switch to solar power? Well, that is surely a good idea. Solar energy is a self-sustaining power resource but unlike your main power line supply you cannot just use solar energy to power your house. Yes, solar energy is converted into direct current by solar panels and most appliances are not designed to work on this form of electricity. Now what? Calm down because the solar panel system is backed with a solar inverter for this purpose. You are aware of inverters, but what are solar inverters? Do they also need sun to work? Come find out about this along with types of solar inverters and other related things.

What are Solar Inverters?

Basically, inverters are devices that convert the direct current (DC) to alternating current (AC) so that it can be used by appliances. Normal inverters use direct current from their batteries, but solar inverters are a bit different. They receive direct current from solar panels that convert solar energy into electric energy. Solar inverters also perform the same function of conversion but instead of taking current from the batteries they feed the solar batteries to charge them.

Whether a solar battery is AC-coupled or DC coupled, both types of power can be transmitted from a solar inverter to charge these batteries. Solar inverters transfer the alternating current to the utility grid and from there it is supplied to household appliances. In the case of an off-grid solar panel system, AC is directly supplied from the solar inverter to the appliances.

Different types of solar inverter serve the same purpose of converting DC to AC. Based on the system with which they are paired with, there are basically 3 types of solar inverters.

These bidirectional inverters include a battery charger and inverter. This type of solar inverter needs batteries to work and can be used in both off-grid and on-grid solar panel systems. However, this is decided on the basis of their UL rating and design. These inverters provide the power backup along with converting it.

Benefits: With this, your grid power consumption is reduced, and it provides a constant power supply. Also, it provides load management, and its operating cost is affordable. Plus, they are easy to maintain.

These larger versions of string inverters are much larger than them and are capable of supporting numerous

## Types of solar power inverters

strings on the panels. In central inverters, string from solar panels is connected together in a combiner box from where DC from panels enters the inverter. Central inverters are suitable for large applications where regular solar power harvesting is done.

Benefits: They have the highest capacity and are suitable for utility-scale systems like solar farms. Their capacities can range from 100 kilowatts to megawatts. Central inverters are packaged with a power station as they are designed to be linked directly to the grid. They are less expensive per kilowatt along with being easy to install and manage.

These inverters are designed to match the phase with a utility-charged sine wave and are mostly used with on-grid solar power systems. Grid tie inverters are ideal for residential, commercial, and office applications. They can easily support small to medium-scale operations.
