Vitamin C is a water-soluble vitamin with a variety of benefits, but our bodies can't make it. We need to consume it through the food we eat or by supplementation.

This article explores what vitamin C does, where we can get it, how much vitamin C is the right amount, and who may need to take supplements.

Vitamin C plays a role in many body functions. The immune system is a key one, mainly due to vitamin C's antioxidant properties.

Antioxidants protect the body from oxidative stress. This is a process that, over time, can cause damage to most organs and tissues in the body. Antioxidants are also known to help support the natural abilities of your

immune system.
