

When to replace ups battery

When to replace ups battery

WHEN IS IT NECESSARY TO REPLACE YOUR BATTERY?

UPS units are the kind of devices that most people forget about until there's a power supply disruption. When that happens, the UPS battery turns on to continue providing power to devices connected to it. But batteries don't last forever, so how do you know when to replace them?

This guide will help you understand the signs you must look for to know when to replace your UPS battery.

Your UPS battery plays a crucial role in protecting your devices during a power outage. That's why you must ensure that you always have batteries that are in excellent working condition.

Here are 6 ways to know when it's time to change your UPS battery:

Most UPS batteries typically last from 3-5 years. However, that lifespan will also depend on the brand and quality of your UPS battery. Higher-quality units will last longer, and cheaper, entry-level versions will have a shorter lifespan.

The first way to know that it's time to replace your UPS battery is if you know it's approaching the end of its lifespan.

As your UPS battery ages, the odds of malfunctioning will increase. Even if you maintain the UPS unit regularly, replacing an aging battery will help you avoid unwanted issues.

Some UPS battery manufacturers provide recommendations for when you should replace the battery. On top of that, some of them also sell replacement kits to help you do so. Always refer to the user manual to understand what the manufacturer recommends for your UPS brand and model.

Some UPS brands and models come equipped with battery health monitoring software or alarms. These additional features provide extra convenience, as they'll continuously gauge the condition of your UPS battery.

So, when the UPS unit senses its batteries are no longer performing within acceptable levels, it'll let you know. For example, the feature will flash an alert on the device informing you that a battery replacement is necessary.
