Who owns tesla supercharger stations

While I believe Tesla's move to open its Supercharger network to other automakers is ultimately going to have a great impact on EV adoption, it is also a smart business move from Tesla.

Here's the business behind Tesla opening its Supercharger network.

Tesla, to no fault of its own, has been using its Supercharger network as a moat in the North American EV market.

While most other automakers selling electric vehicles left the charging experience in the hands of third-party charging networks, Tesla built its own network, which is now widely recognized as the best, most extensive, and most reliable one.

It helped Tesla sell its electric vehicles and retain customer loyalty as Tesla owners would have a hard time going to another automaker and not being able to use the Supercharger network anymore.

However, Tesla never really intended to use the network as a moat. It simply happened as it developed its own charge connector early while the rest of the industry decided to go with the subpar CCS connector.

In 2022, Tesla ended up opening its charge connector, now known as NACS, to try to make it the new industry standard in North America. Over the course of the last year, all automakers ended up adopting the standard.

Ford was the first to get the ball rolling, and today, Ford EV owners are the first to get access to the Supercharger network. Soon, almost all EV owners in North America will be able to use the Supercharger network. First, with an adapter, but soon the NACS charge connector will be standard in all vehicles.

It wasn't long ago that Tesla wasn't even charging Tesla owners for using the Supercharger network. It was purely a perk meant to create a better experience for Tesla owners.

As the fleet grew, Tesla naturally started charging for Supercharger usage.

Now that Tesla is onboarding Ford EV owners on the network, we are learning more about the business behind it and Tesla's approach.

Unsurprisingly, Tesla is charging Ford EV owners differently than Tesla's own EV owners. Looking at the costs at different charging stations in the US and Canada, it looks like Tesla is charging Ford EV owners about a 30% premium per kWh of charging at Superchargers on average.
