Waste Management - Wind Energy and Power Calculations | EM SC 470: ...

In this lesson, we'll go over some of the basics of wind and microhydroelectric ...

Theoretically power in moving air - or wind - can be calculated

$A$  = wind mill area perpendicular to the wind ( $m^2$ )

Be aware that the density of air decreases with temperature and altitude and that the major factor in wind power generation is wind speed .

The theoretical and rated wind power generation from a typical windmill is indicated in the "wind speed-power curve" below. Cut-in wind speed, rated wind speed, shut-down wind speed and rated power for windmills with 20% and 40% efficiency.

Actual available wind power can be calculated

- free apps for offline use on mobile devices.

The calculator below can be used to calculate the available power from a windmill:
