The United States is home to one of the largest and fastest-growing wind markets in the world. To stay competitive in this sector, the Energy Department invests in wind research and development projects, both on land and offshore, to advance technology innovations, create job opportunities and boost economic growth.

Moving forward, the U.S. wind industry remains a critical part of the Energy Department's all-of-the-above energy strategy to cut carbon pollution, diversify our energy economy and bring the next generation of American-made clean energy technologies to market.

The Wind Energy Technologies Office invests in wind energy research and development (R&D) activities that enable and accelerate the innovations needed to advance offshore, land-based, and distributed wind systems; reduce the cost of wind energy; drive deployment in an environmentally conscious manner; and facilitate the integration of high levels of wind energy with the electric grid.

WETO funds research nationwide to enable the development and deployment of offshore wind technologies that can capture wind resources off the coasts of the United States and convert that wind into electricity.

WETO's work in land-based wind R&D includes both utility-scale and distributed wind energy. This includes work on large wind turbines with taller towers and longer blades to capture more energy at a lower cost, as well as technology development and deployment of small wind turbines in distributed applications. Our R&D aims to improve wind plant performance and advance wind energy technologies for nearby energy consumers.

WETO supports R&D efforts to help reduce barriers to wind power deployment and increasing the acceptance of wind power technologies by addressing siting and environmental issues. To support environmentally sustainable development of wind energy in the United States, WETO invests in innovative, cost-effective technologies that can refine our understanding of these risks and minimize wildlife impacts at land-based and offshore wind farms.

WETO collaborates with wind technology suppliers to increase reliability while lowering production costs, and to promote an industry that can meet domestic demands while competing in the global market. To bolster

the domestic supply chain, WETO supports investment in domestic wind turbine manufacturing and research in workforce development and education efforts. WETO's investments seek to improve America's international competitiveness in a time of fast-growing global interest and support vast growth potential for domestic manufacturing with opportunities for good-paying jobs.

WETO supports R& D efforts to accurately define, measure, and forecast the United States land-based and offshore wind resources, optimize wind plant performance, and make data and maps available to the public.

WETO conducts R& D and works with electric grid operators, utilities, regulators, and industry to incorporate increasing amounts of wind energy into the power system while maintaining economic and reliable operation of the grid.
